CHERRY COSMETICS — DEPLOYMENT GUIDE

Java Swing + MySQL/MariaDB + NetBeans

REQUIREMENTS

- Windows computer

- JDK 21

- NetBeans IDE with Apache Ant support

- XAMPP with MySQL/MariaDB

- MySQL Connector/J

SET UP THE DATABASE

1. Open XAMPP Control Panel.

2. Start MySQL. Resolve port 3306 conflicts before continuing.

3. Open phpMyAdmin in your browser.

4. Select Import and choose database/schema.sql.

5. Execute the import and confirm that cherry_cosmetics contains the users, categories, products, orders, order_items, and payments tables.

SET UP THE JAVA PROJECT

1. Download MySQL Connector/J from the official MySQL website.

2. Copy the connector JAR into the project's lib folder and name it mysql-connector-j.jar.

3. Open NetBeans.

4. Select File > Open Project and choose the folder containing build.xml and nbproject.

5. Confirm that nbproject/project.properties references lib/mysql-connector-j.jar.

6. Open src/cherrycosmetics/data/Database.java and verify the JDBC URL and MySQL credentials.

7. Select Clean and Build Project.

8. Run cherrycosmetics.Main.

VERIFY THE APPLICATION

1. Log in using the demo administrator credentials below.

2. Register a test customer and verify that duplicate usernames and emails are rejected.

3. Browse products and test cart quantities and checkout.

4. Update an order and verify the status in the customer view.

5. Test product management, archiving, reports, CSV export, and eligible PNG receipts.

6. Open phpMyAdmin and verify that records are saved in the correct tables.

DEMO ADMINISTRATOR

Username: admin

Password: Cherry@2026Admin!

PASSWORD SECURITY

Passwords are stored as salted PBKDF2-HMAC-SHA256 hashes. New and reset passwords must be at least 12 characters and include uppercase and lowercase letters, a number, and a symbol. Existing plain-text passwords are upgraded when the application starts. An existing plain-text administrator account is reset to the demo administrator password. Change the demo password before any real use.

LIMITATIONS

The forgot-password screen checks the username and email supplied but does not verify control of the email inbox. Payment details are recorded; the system does not process actual online payments. MySQL Connector/J is not included in the ZIP and must be added before running the application. A successful build does not guarantee database connectivity.
